Selecting the correct Invacare sling size

Selecting the right size

To select the correct sling size, the most important measurements are the hip width and back height in the sitting position. For slings with belts, the waist circumference is important, too.

Invacare Slings sizes and safe working load

► Size	XS	S	M	L	XL	XXL
► Safe Working Load	200 kg	200 kg	200 kg	200 kg	250 kg	300 kg

The client's weight needs to be considered mainly for the sling's maximum safe working load. It's inferior to indicate the right sling size.

If no head support is needed, the correct back height is from the lower back until the shoulder/neck. With the need of head support the measurement needs to include the head, too.

► If the sling is too big, the client may slip out. If the sling is too small, the client may still slip out, particularly with less body control. It could also exasperate the client's medical condition. When selecting a size, if your client is in-between sizes, having a slightly smaller sling, could keep your client more secure.

Some medical conditions such as stroke, orthopedic conditions, amputations or certain wounds may affect sling choice.

Selecting the correct Invacare sling size

Measurements

One of the most important factors to perform a safe transfer is the match between hip/trochanter width and the measurement of the sling's opening between the leg support. If between sizes the smaller size may keep the client more secure.

Invacare Slings with divided legs

Universal family with regular opening		XS	S	M	L	XL	XXL
